

SPAMINA ADDS NEW FEATURES TO ITS CLOUD EMAIL ARCHIVING SOLUTION

Improves user experience with enhanced management and access capabilities

Reading, 5 April 2011 – Email security company Spamina, today announced the addition of new features to its Cloud Email Archiving solution. The recently launched product allows businesses to maintain a secure, searchable record of all email communications, hosted entirely in the cloud, for compliance and e-discovery needs.

The new features added to the solution include enhanced management and access capabilities for archive administrators, allowing them to determine if a user can read, file, export or forward an email in line with data protection standards.

The user experience has also been improved by the ability to view mail headers and the addition of sub filters within the search function.

Spamina's Cloud Email Archiving Solution is compatible with any standard mail server, and is equipped with multiple category searches, advanced search and indexing characteristics and flexible administration tools that allows more than one user access to a file simultaneously.

The product will now be featured as part of Spamina's total email security suite, which also includes Spamina's Cloud Email Firewall and Cloud Email Encryption & DLP solutions. The suite, hosted via private, public or hybrid cloud models, allows businesses a 360-degree approach to email security from a single management console.

UK country manager for Spamina, Dan Power adds, " Spamina's Cloud Email Archiving solution already provides businesses with a reliable way to store and manage their emails. These new features will allow us to build on the product and improve the user experience for our customers."
