

## **Spamina Shows Complete Email Security Solution at Infosecurity 2011**

### ***New Cloud Email Encryption and DLP solution highlighted***

**27, April , 2011** – Email security specialist Spamina presented their cloud email encryption and DLP (Data Loss Prevention) solution at Infosecurity in London last week.

Spamina's email firewall solution is currently used in more than 10 million email users around the world. The company recently added hosted email archiving to the solution allows businesses to maintain a secure, searchable record of all email communications with immediate access to archived emails for compliancy and e-discovery needs. The email encryption / DLP solution is the latest and final component of their complete Cloud Email Security Suite.

'Spamina Cloud Email Encryption & DLP' allows organisations to set individual privacy policies at the company, domain or user level. In addition the solution can automatically encrypt emails based on features such as keywords and apply automatic data loss prevention rules for confidential information as well as digital signatures that verify the email sender. These features prevent sensitive information from being distributed to unintended recipients and confirms the authenticity of the email, while at the same time ensuring ease of use for the business.

Jim Tyer, International Sales Director of Spamina said: "Our presence at this year's Infosecurity confirms our presence as a key player in the cloud email security area in the United Kingdom as well as the rest of Europe. Our consolidated solution is unique and is offered at a price point attractive to both resellers and organisations. We believe that Infosecurity is a unique event focused on security and allowed us to effectively present our solutions to industry insiders as well as potential international partners."
