

SPAMINA SETS UP CONTINUOUS FEEDBACK LOOP, SUPPORTS CONTINUED INNOVATION WITH ESTABLISHMENT OF SPAMINA LABS

Spamina, a leading Spanish developer of innovative email security solutions, has established Spamina Labs, an advanced research and development department whose main objective is to develop new and ever-more effective approaches to the continuing problem of email security. Successful innovations are thoroughly tested and then integrated into the company's solutions, delivering the benefits of these new ideas directly to the customer.

The core focus at Spamina Labs is and will remain the needs of users, anticipating their needs and continually working to improve the usability of the products. Such a dynamic operating environment requires constant proactive communication between internal Spamina staff and end-user customers. The company has restructured its operations to support a continuous feedback loop between presales, delivery, support, and the research team in the Labs. In this way, the work that comes out of Spamina Labs is a direct result of customer needs and can be delivered back to those customers seamlessly through solution updates, made simple and painless for the customer thanks to the company's extensive use of the cloud as a delivery mechanism.

"Spamina Labs is an invaluable research and development resource that helps us to bring to market solutions that are at the cutting edge of technology," says Susana Duran, Chief Technology Officer at Spamina. "Innovation is key to our growth and that of our partners, and to be able to derive that innovation directly from concepts suggested by our customers is priceless."

A successful example of the continuous feedback loop is the recent development by Spamina Labs of a new storage and indexing mechanism for LOGS mail. The result of this investigation has allowed for significant parsing improvement for logs stored in MongoDB in the company's solutions.

Spamina's product development team is continually broadening and increasing the value-add of its solutions. The company also supports a network of OEM partners, so new developments take into account the needs of third-party products that integrate Spamina's technology as well as direct business customers looking to boost security and increase ROI. Research areas in which Spamina Labs operate includes usability, scalable software architecture, email filtering techniques, learning and adaptation of filtering mechanisms, and more.

About Spamina

Spamina develops and delivers innovative email security solutions in that make use of Public Cloud, Hybrid and Private Cloud environments. Designed for all types of businesses and service providers, Spamina's solutions include Email Firewall, Archiving, Encryption and Data Loss Prevention capabilities that minimize the workload for system administrators while delivering exceptional security and regulatory compliance for users and retaining total control over email inside the business.
